

ONE TRACEABILITY SOLUTION. EVERY PRODUCT LINE.

Offline-first requirement-to-code analysis, with AI used only where engineering judgment needs support.

WHAT THE TOOL DOES

Reads Excel requirements → scans .cpp / .h / .epc / .cfg → identifies missing traces → generates review evidence and Copilot-ready implementation analysis

OFFLINE-FIRST

Core scanning and comparison run locally; AI is reserved for unresolved gaps.

LOWER AI USAGE

Focused prompts and selected code evidence reduce avoidable token consumption.

PRODUCT-AGNOSTIC

Additive Trace ID patterns support different FCIs, products, and future conventions.

STRATEGIC VALUE

**Earlier gap detection • repeatable quality evidence
• scalable reuse • human-controlled decisions**

Designed for approved whitelisted and non-whitelisted workflows, subject to program security and AI-governance rules.

CONFIDENTIALITY-AWARE AI OUTPUT

Only selected unresolved-gap context is prompted. Under approved GitHub Copilot Business / Enterprise controls, interaction data is not used for model training; handling remains subject to program policy.
